ATI Water Monitor App: User Manual

Entry, automatic calculation, automatic writing to the Google Sheet and comparison with other ATIs

1. What the app does

ATI Water Monitor is a smartphone app for recording the water level of the FP (Farmers' Practice) plot and the 3F4D+MD plot. When you save, the data are written automatically into the shared Google Sheet prepared by the teacher, through a script in the sheet (Google Apps Script). The dashboard shows the data kept in the sheet, not only the data on the phone. You can compare your ATI with the other ATIs in graphs.

Step	What happens
1. Enter	Students enter water level, irrigation, rain, fertilizer, pesticide and tiller counts in the app. Water level, irrigation and so on are calculated automatically.
2. Written automatically	When you save (for example "Save entry"), the data are written into the shared sheet a few seconds later. No pasting is needed.
3. Show and compare	Graphs and Compare show the data in the sheet. You can compare your ATI with the other ATIs in graphs.

Saving to the Google Sheet is required. "Save entry" cannot be pressed until the app is connected to the sheet.

2. Teacher setup (Excel template and sheet script)

The administrator (for example a teacher) does this once. All ATIs that want to compare use the same sheet.

1. **Make the sheet**: in the app, open More > For the teacher and download the template ATI_Monitor_Shared_TEMPLATE.xlsx with "Excel template". Upload it to Google Drive, open it and choose "File > Save as Google Sheets".
2. **Paste the script**: in the sheet open "Extensions > Apps Script". Delete the sample code that is already there, paste the script and press Save (the disk icon). You can copy the script with "Copy script" in the app (More > For the teacher); "Download script (.gs)" gives the file.
3. **Publish (deploy)**: press "Deploy > New deployment" at the top right. Use the gear icon to choose the type "Web app". Set "Execute as" to "Me" and "Who has access" to "Anyone", then press "Deploy".
4. The first time, an "Authorize access" screen appears. Choose your Google account. "Google hasn't verified this app" is shown, which is normal for a script you made yourself. Press "Advanced" > "Go to (project) (unsafe)" > "Allow".
5. **Web app URL**: when the deployment is done, a URL ending in "/exec" is shown. Copy it. (To see it later, use the sheet menu "ATI Monitor > Show web app URL".)
6. **Connect the app**: in the app, open More > For the teacher and paste the URL into "Web app URL". Press "Test connection" and check that it says "Connected". Press "Create class setup link" to make one link, and send that link to the students. When a student opens it, the URL is filled in automatically.

> **Note:** Anyone who knows the URL can write data, so give the URL and the class setup link to the

> students only. If data are deleted by mistake, restore them with "File > Version history". If you change the script, update it with "Deploy > Manage deployments > Edit > New version".

What is in the sheet: On every save, the rows of that ATI are replaced (the sheet does not keep growing). The tab "Data" lists the daily results in a readable form, the tab "ATIs" has one summary row per ATI, and "_Store" is a hidden tab used by the app. The script fills them in. Do not edit them by hand, and do not change the header rows or the tab names.

3. How students use it

3.0 The five buttons at the bottom

Button	What it shows
Today	Whether today's entry is done, the latest water level, and "now" and "next" in the schedule. The three first steps also appear here.
Entry	Three parts: Water level (every day), Field records (fertilizer, pesticide, tillers) and TP / b (re-measurement).
Graphs	Graphs of water level, irrigation and saving of your ATI.
Compare	Comparison with the other ATIs in the sheet.
More	Setup, Schedule, Google Sheet & sharing, Help, For the teacher, demo.

3.1 The first time

- Open the "class setup link" from the teacher in Chrome on the phone. This connects the app to the shared sheet. In Chrome, choose "Add to Home screen" to start the app from an icon.
- **More > Setup**: enter ATI name*, place*, sowing date*, seedling age at transplanting*, and TP and b* of FP and 3F4D+MD (* = required). While a required item is empty, or the app is not connected to the sheet, "Save entry" in the Entry tab cannot be pressed. The first screen, Today, shows whether these three steps (connect to the sheet, Setup, first entry) are done.
- **More > Schedule**: planned dates appear automatically. When you have done the work, open "Enter actual date / change plan" in that row and enter the actual date.

How to read m, TP and b: see the figure below. m = tape reading at the water surface, TP = tape reading at the top of the pipe, b = height of the pipe top above the ground (measured with another scale). Water level = m − TP + b. A negative value means the water is below the ground.

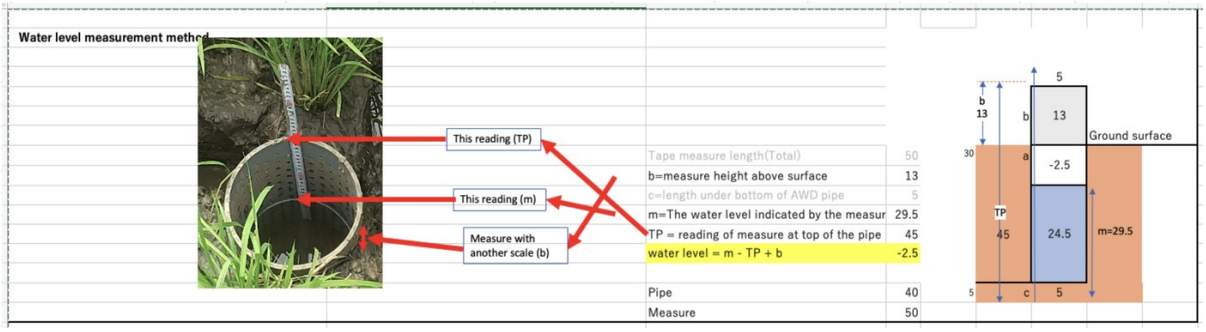

Figure: how to measure the water level (example: m = 29.5, TP = 45, b = 13 gives a water level of −2.5 cm)

3.2 Every day

1. **Today > Enter today's water level** (or Entry > Water level): enter the tape reading (m) of FP and 3F4D+MD. The water level (for example −2.5 cm, below the soil surface) appears at once

under the box. The − and + buttons change m by 0.1 (starting from the last value when the box is empty). If you irrigated, choose "Yes" and enter the readings before and after irrigation; the irrigation (mm) also appears at once.

2. "Save entry" becomes active when all required items (*) are filled and the values are in range. Missing items are shown in red under the button.
3. After saving, the data are written into the sheet automatically a few seconds later. The line above the dashboard shows the state.

Message	Meaning and what to do
Not yet saved in the Google Sheet.	The sheet does not have it yet. It is sent automatically when the phone is online. You can also press "Send now".
Saved in Google Sheet	The sheet has it. This is the normal state.
No internet or no answer…	No internet, or the sheet does not answer. It is sent again when the connection is back. If this continues, ask the teacher to check the URL and the deployment.
The sheet script refused the data…	The sheet script did not accept the data. Tell the teacher.

You can also keep a photo of the pipe ("Add photo"). Photos stay on that phone only and are not sent to the sheet.

You can enter and save in the field without internet. The data stay on the phone for a while and are written into the sheet when the phone is online again.

Input	Required items
Setup	ATI name, place, sowing date, seedling age, TP and b (both plots)
Entry (water level)	Date, m of FP, m of 3F4D+MD. If irrigation is "Yes": the readings before and after irrigation of that plot
Field records: fertilizer	Date, plot, at least one fertilizer amount (kg)
Field records: pesticide	Date, plot, type, chemical name
Field records: tillers	Date, plot, tiller counts of all 5 hills (whole numbers). The value used is the mean of the 2nd, 3rd and 4th largest
Re-measure TP and b	Plot, date, TP, b

3.3 Correcting entries

- Water-level entry: press ✎ in the Entries list under Entry > Water level, change the values and press "Save entry" again (the same date is overwritten). ✕ deletes the day.
- Fertilizer, pesticide, tillers (Entry > Field records), TP and b (Entry > TP / b): press ✎ in the list, change the values and press "Update". Press "Cancel" to stop.
- After a correction the new version is also sent automatically. In the sheet, the newest version of the same ATI is used.

3.4 Continuing on a new phone

- Open the class setup link. In More > Google Sheet & sharing > Restore from the sheet, type the ATI name (exactly as in the sheet) and press "Restore from sheet". The data in the sheet come back to that phone.

4. Comparing with other ATIs (Compare tab)

- The Compare tab reads all ATIs in the sheet when the app opens (and again every 5 minutes). Press "Refresh from sheet" to read again. Tick the ATIs you want to see.
- Your own ATI is drawn with thick lines. The x axis is days after transplanting (DAT).
- Graphs: total irrigation and saving (FP vs 3F4D+MD), cumulative irrigation, water level, tiller number.
- "View" switches the display. "Overlay" draws all ATIs in the same graph. "Each ATI" shows a separate panel with water-level and cumulative-irrigation graphs for every ATI. It also works without data of your own (for example when a teacher looks at all ATIs).
- To see how Compare looks without connecting to the sheet, use More > Try with demo data (demo ATIs also appear in Compare). Nothing is sent in the demo.

5. Demo, backup and other points

- **Demo:** More > Try with demo data opens the app with example data. Nothing is saved or sent. Press "Exit demo" at the top to leave.
- **Backup:** The master copy is the sheet. The phone also keeps a copy until it has been sent. You may also use "Export file (JSON)" in More > Google Sheet & sharing from time to time.
- **View-only link:** "Create link" in More > Google Sheet & sharing makes a link that shows only the graphs.
- **Language:** The button at the top right switches English and Bengali. The Bengali is a draft and needs checking.

6. Notes and limits

- Each ATI name must be unique. The same name is treated as the same ATI.
- On every save, all data of that ATI are written into the sheet (not a difference). The script fills in the sheet; do not edit it by hand.
- If the same ATI is used on two phones, the version saved last is the newest in the sheet. Press Refresh to load the newest before entering data.
- Verified: the app's calculations equal the original Excel values; required-item checks, corrections, demo, writing to the script and restoring/loading from the sheet (with a mock in place of Google, including two simulated phones). The script itself (write, replace, read) was also tested on a mock sheet.
- Not verified: a real Google Sheet (the authorization screens, deployment, writing, reading), behaviour on real phones, correctness of the Bengali. Test with the first ATI before handing it out.
